

Micro Magic Polishing System

Dr. Kirk's Micro Magic is an easy 3 step system that works its magic in only minutes leaving you with a perfect surface without the hassle of wet sanding. Let's Get Started!

Preparation

Have your blanks sanded up to 600 grit or higher. Be careful when sanding, too much heat build up can damage and often times ruin the blank. Use a clean paper towel to remove all of the sanding dust.

Polishing

1. Using a soft paper towel, apply a small amount of Micro Magic Step 1 (red jar) and polish the blank. Once the blank is polished, use a clean paper towel to buff the blank.
2. Repeat the process using Micro Magic Step 2 (white jar) to further polish the blank. Using a clean paper towel, buff the blank.
3. Apply a small amount of Micro Magic Step 3 (blue jar), with a paper towel and polish the blank to a final finish and your done. It's that easy!

Micro Magic™ step 3 includes a UV inhibitor so you can use it as a final finish on stabilized blanks to protect against oxidation. Micro Magic also produces excellent results on CA finishes too!
